Cartesian Coordinate System (aka $\qquad$ ) is a $\qquad$ number line (the $\qquad$ ) intersecting with a $\qquad$ number line (the___ ) at right angles at the zero coordinates of each line (the $\qquad$ ).

Quadrants are the $\qquad$ areas of the Cartesian coordinate system formed by the intersecting number lines. Quadrants are designated by $\qquad$ from $\qquad$ to $\qquad$ beginning in the upper right and proceeding $\qquad$ .
$\mathbf{x}$-axis is the $\qquad$ number line. From o to the $\qquad$ is negative, from o to the $\qquad$ is positive.
$\mathbf{y}$-axis is the $\qquad$ number line. From o down is $\qquad$ from o up is $\qquad$ .

The Origin is the intersection of the two $\qquad$ at their
$\qquad$ , thus its coordinates are $\qquad$ , ).

A Point is any location on the $\qquad$ coordinate system. Every point has a $\qquad$ and a $\qquad$ component that establish its position on the coordinate plane in relation to the $\qquad$ .

An Ordered Pair is the pair of coordinates that $\qquad$ the location of a point on the coordinate plane in relation to the $\qquad$ . The ordered pair gives the $\qquad$ to the point from the $\qquad$ . Ordered means that the $\qquad$ -coordinate ALWAYS comes first and the
$\qquad$ -coordinate ALWAYS comes second, separated by a $\qquad$ .

The $\mathbf{x}$-coordinate gives the $\qquad$ and $\qquad$ of the point from the origin along the $\qquad$ number line, the $\qquad$ axis. The x-coordinate will ALWAYS be listed $\qquad$ in an ordered pair.

The $y$-coordinate gives the $\qquad$ and $\qquad$ of the point from the origin along the $\qquad$ number line, the $\qquad$ axis. The y-coordinate will $\qquad$ be listed second in an ordered pair.

Plot: to $\qquad$ a point on the coordinate system starting at the
$\qquad$ and using the ordered pair of coordinates, first $\qquad$ then .
linear equation: an equation in one or more $\qquad$ in which no exponent has a power other than $\qquad$ . Called linear because the graph of a linear equation in two variables is a $\qquad$ .

The Standard Form of a Linear equation in two variables is: $\qquad$ $+$
$\qquad$ = $\qquad$ , where $\qquad$ , $\qquad$ , and $\qquad$ are $\qquad$ and $\qquad$ and $\qquad$ are $\qquad$ in alphabetical order.

The Solution of a linear equation in two variables is the set of all
$\qquad$ that satisfy (make a true statement of) the equation. When we try to graph all the $\qquad$ , we will get a $\qquad$ .

## Three Methods to graph a line:

1. $\qquad$
2. $\qquad$
3. $\qquad$
The graph of a line: the representation of the $\qquad$ of a linear equation in two variables on the coordinate system.

An ordered pair is on the line when its coordinates are a $\qquad$ to the equation.

Intercepts: the point where the line crosses one of the $\qquad$ . The of the intercept specifies which $\qquad$ is crossed and which coordinate will probably have a value other than $\qquad$ . The only time both coordinates are $\qquad$ is when the line intercepts the
$\qquad$ .

The $\boldsymbol{x}$-intercept is where the line crosses the $\qquad$ -axis and has coordinates ( $\qquad$ , $\qquad$ ).

The $\boldsymbol{y}$-intercept is where the line crosses the $\qquad$ axis and has coordinates ( $\qquad$ , $\qquad$ ).

Slope: We use the letter $\underline{m}$ to represent slope because DeCartes is French. The slope tells us the RATE of Change between points on the same line. It also gives directions from a point on a line to another point on the same line. The slope is often referred to as the Rise over the Run.

Rise: the difference in the $\qquad$ between two points on the same line, usually written as $\qquad$ .

Run: the difference in the $\qquad$ between two points on the same line, usually written as $\qquad$ .

## Slope - Intercept Equation: $y=m x+b$

m is the $\qquad$ and $b$ is the $\qquad$

Parallel lines have the same $\qquad$ and different
$\qquad$ .

## Perpendicular lines intersect at right angles and their slopes are <br> $\qquad$ .

The graph of a linear equation will be one of four possible lines:
Rising line: line slants up from left to right on the graph. The slope is ALWAYS $\qquad$ . IS a function.

Falling line: line slants down from left to right on the graph. The slope is ALWAYS $\qquad$ . IS a function.

Horizontal line: line is straight across the graph from left to right, neither rising nor falling. The slope is ALWAYS $\qquad$ . IS a function.

Vertical line: line is straight up and down the graph. The slope is ALWAYS $\qquad$ . IS NOT a function!!

Point - Slope Equation Form: $\qquad$ $=$ $\qquad$
function: a special case of mathematical statement where an
$\qquad$ is matched to only one $\qquad$ .
function notation: $f(x)=\mathrm{a} x+\mathrm{b}$
$f$ is the $\qquad$ of the function
$x$ tells us $\qquad$ for the variable
$\mathrm{ax}+\mathrm{b}$ (an expression, just like in Unit 1) tells us how to $\qquad$ the function for the given value.
$x$ is the $\qquad$ ,
the calculated value of $f(x)$ is the $\qquad$ .
domain of a function: the set of all values that may be $\qquad$ to the function.
range of a function: the set of all of the possible values that will result from $\qquad$ the function for an input. All the possible of the function.
Table: a set of ordered pairs presented in tabular format; paired $\qquad$ and $\qquad$ listed as X and Y 1 on the graphing calculator (Press [2nd] [GRAPH]).

Input: the value typed in or $\qquad$ for x in the expression or function being evaluated.

Output: the $\qquad$ value, Y1 on the graphing calculator, of the expression or function using the input value.

Percent Change formula: To find the percent change between two values, divide the difference of the new $(\mathrm{N})$ value and the previous ( P ) value by the previous value, then multiply times 100: \%change $=(\mathrm{N}-\mathrm{P}) / \mathrm{P} * 100$

Thickness formula: $\mathrm{T}=\mathrm{V} / \mathrm{A}$
volume (V, ALWAYS in $\qquad$ units)
area (A, ALWAYS in $\qquad$ units):

Slope formula: $\mathrm{m}=(-\quad) /(-)$
Distance formula: $\mathrm{d}=$
Polya's Method: a structured approach to solving applications (word problems). has four steps:
(1) ; (2) ; (3) ; (4)
